Volume XL – Number 9

Issued Monthly

September 25, 2020

HONEY MARKET FOR THE MONTH OF AUGUST 2020

IN VOLUMES OF 10,000 POUNDS OR GREATER UNLESS OTHERWISE STATED

Prices paid to beekeepers for extracted, unprocessed honey in major producing states by packers, handlers & other large users, cents per pound, f.o.b. or delivered nearby, containers exchanged or returned, prompt delivery & payment unless otherwise stated.

- REPORT INCLUDES BOTH NEW AND OLD CROP HONEY - (# Some in Small Lot --- +Some delayed payments or previous commitment)

CALIFORNIA

COLONY, HONEY PLANT AND MARKET CONDITIONS DURING AUGUST 2020

APPALACHIAN DISTRICT (MD, PA, VA, WV): August was much like July with many hot, humid days with even fewer isolated showers and thunderstorms. Remnants of Hurricane Isaias also traveled through the District providing rain and little wind in early August. Beekeepers reported bearding behavior, and several had to requeen colonies. Nectar and pollen supplies are very light as the District was in its dirth period; however, a few bees were gathering nectar and pollen from crape myrtle, coneflower, narrow leaf plantain, joe pye weed, hoary mountain mint, bergamot, jewelweed, ragweed, goldenrod, sunflowers and other wildflowers. Beekeepers were providing pollen and food to supplement bees during the dirth. Overall health is reported as good, with only occasional reports of small hive beetle, mite, and wax moth issues. Wholesale honey prices on the Baltimore Wholesale market were \$6.25-7.25 per one pound container.

ALABAMA: Variable weather throughout the state – dry in some regions but wet in others meant that most honeybee colonies relied on their food stores rather than potential floral resources in the environment for their carbohydrate source. As a result, some beekeepers needed to feed their colonies with sugar syrup. Reports across the state indicated that varroa levels continued to rise, as expected, because brood rearing slowed down as a result of the dearth in forage. In some cases, very high levels of small hive beetles in colonies were also reported. Physical distancing measures implemented because of COVID-19 continued to restrict in-person group events. As a result, larger regional meetings normally planned were cancelled.

ARIZONA: Temperatures were at above normal levels across the state of Arizona during the entire month of August. The state has seen a record number of days with temperatures over 110 degrees. Lower than normal precipitation levels have caused dry, and in many cases, drought conditions to continue to persist across the state. Various desert plant bloom, alfalfa and cotton were the main sources for nectar and pollen in the state.

Despite these conditions, there has been an increase in sales of honey across the state, as more businesses and markets open. Demand for honey across Arizona remains good and is expected to continue to do so for at least the next month.

ARKANSAS: During the month of August temperatures were mostly below normal across most of the state. Precipitation during August was slightly below normal across most of the state. According to the U.S. Drought Monitor website, Arkansas had mostly normal soil moisture for August. Too few prices exist to establish a current market price for wholesale white honey.

CALIFORNIA: Fire and heat continued to severely limit California honey production in August. Beekeepers anticipate heavy artificial feeding ahead to rebuild colonies for winter. “There is no ground moisture, so all our fall plants have failed,” one beekeeper said. “We will be feeding a large amount of syrup and patties for the remainder of the year.” “What with the glut of almonds being harvested, we now wonder whether next season's pollination prices will allow us to recoup our investment,” another noted.

Most of the month, hives were left exposed to thick layers of smoke and a few days of intense heat, another beekeeper explained. “The bees do not fly much as the smoke was so dense that it blocked most of the sunlight, and any blooming plants shut down,” he said.

“There has been no honey production. Although some pollen has been available, the bees have eaten up most of their honey stores, and we are feeding syrup to almost all colonies. Most colonies have large populations of bees, so they consume a lot of feed.” Some say that despite the heat, they were surprised to see yellow star thistle produce nectar in mid-August, which helped. Before that, early in the month, some hives were able to collect nectar from cotton. Other hives were out of state, like those in alfalfa fields in Nevada. But by mid-August, forest fires flared up, and smoke began to engulf large areas inhabited by hives. “There have been hundreds, if not thousands of beehives destroyed in California fires to date,” a beekeeper said. “The exact numbers are not known at this time, but some beekeepers got hit particularly hard, certainly impacting bee supply for almond pollination. There are many hives still in danger now in California, Oregon, and perhaps other states as well due to the unprecedented fires.” “We had to emergency evacuate three yards of hives, escorted into the evac zones by Animal Control,” another beekeeper said. “But they wouldn't let us into one zone, so we had to wait until yesterday (September 14) to check the 70 hives. The fire had burned up to the asphalt road but hadn't crossed over into our apiary! We lucked out.”

One beekeeper said he'd managed to extract honey from hives in early September. “It was our first, last and only day to do so this year,” he said. “We managed to secure 2.5 percent of an average crop, and the quality was very poor.”

Despite the scarcity of new honey this summer, some said overproduction last year as well as increased imports of honey from Argentina and Brazil had kept the market at \$1.50-\$1.70 per pound.

Beekeepers also needed to replenish even more queens, which haven't been productive as before, something some beekeepers attribute to heavier use of medications that could cause sterility and limit productivity. “You're lucky if you can get a full year out of a queen,” a beekeeper said.

FLORIDA: Temperatures and precipitation were about normal during August, with temperatures in the low to upper 90's and numerous afternoon thunderstorms or showers in most areas. Bee health was considered good as many beekeepers who had split hives were supplemental feeding to grow their bees. There were few sources of natural food except for Spanish Needle, Mexican clover, and assorted wildflowers including a little goldenrod which began blooming in late August. A few bees returned to Florida from other states by the end of the month, but all are not expected to return until sometime in September or even October. Bee losses during the year so far were estimated by some to be about normal, around 35-40%, with no abnormally high losses being reported. Beekeepers are preparing for the Brazilian Pepper season which should begin blooming between the 7th and the 15th of September. Full bloom should last for 2-3 weeks depending on rainfall and ending sometime in late September or early October. Pepper honey should begin to be pulled by the middle of October. There was practically no stored honey at the end of the month.

GEORGIA: Most beekeepers are treating hives all year for mites and beetles. Those that have not are reporting losses and this has hobby beekeepers very discouraged and many are leaving the business as they don't like the extra expenses of upkeep, replacing bees and purchasing Queens and Nucs. The cotton crop has been up and down with a late planting and the hot weather has affected the dryland corn fields the most and it has impacted honey production in those areas. With a short cotton crop for the bees to work with volume is expected to be low for the Fall pulling.

IDAHO, COLORADO, UTAH: During the month of August, temperatures in Idaho, Utah, and Colorado were above normal across most of the area. Idaho and Utah experienced slightly below normal precipitation during the month. Colorado experienced well below normal precipitation during the month. According to the U.S. Drought Monitor website, Idaho had normal soil moisture, with the exception of Central Idaho having abnormally dry conditions in August. That was a slight improvement over July. Utah and Colorado had moderate to severe drought conditions across most of those states.

Beekeepers, in all three states, have had to provide supplemental feed for their bees all summer due to the dry conditions. These conditions are making it very hard for bees to find a good source of nectar. The good nectar available in early July disappeared in August.

There were too few sales reported to establish a market for local honey.

ILLINOIS: The weather for August was hot with very little rain. Beetles, varroa mites and yellow jackets are causing a few problems, but beekeepers report that most of their bees are in good condition. Beekeepers also report that there are Dutch clover, alfalfa, soybeans and aster for the bees. Beekeepers report that a decent amount of honey was produced, but that it will not be extracted until next month. Demand for honey is good at the retail level and fairly good at the wholesale level. Prices are generally unchanged with some higher retail prices.

INDIANA: The weather for August fluctuated from cooler to warmer than average temperatures with a few very hot days. Few problems with insects were reported. Most of the bees are said to be in good condition. Beekeepers report average amounts of honey production. Demand for honey is good at the retail level and fairly good at the wholesale level. Prices are generally unchanged.

IOWA, KANSAS, MISSOURI, NEBRASKA: No report issued.

KENTUCKY: Kentucky enjoyed extended nectar flows so much that some beekeepers are taking a second harvest. In other parts of the state, namely the Pennyrile and South Central sections of KY, beekeepers provided supplemental food as inspections revealed that many hives have consumed honey stores, despite a plethora of floral bloom of many species such as goldenrod, summer sweet, native sunflowers such as tickseed and woodland sunflowers, wingstem, ironweed, coneflowers, and milkweeds providing nectar and pollen. Whereas August in 2019 was "fried and dried," August 2020 in Kentucky was comparatively lush and comfortable, with timely rains.

While prices for Kentucky honey remained high and the demand for honey remained strong, the seminal event for KY beekeepers to market their honey, i.e., the Kentucky State Fair, was cancelled this year, due to Covid-19 virus. This meant that for many beekeepers, they lost revenue as well as a chance to establish a network with potential buyers after the Fair had ended. One direct economic casualty of the corona-virus has been to the KY State Beekeepers Association and its members, since this is the primary fundraising event for this association.

In terms of hive health, with the exception of a case of European foulbrood, several cases of parasitic mite syndrome, and a hive lost to Greater wax moth, Kentucky hives seem relatively healthy. Varroa mite counts tend to be higher across this state, but that is no surprise this time of year. A crucial point to note is that many beekeeper associations have not met since March, and many new beekeepers are not getting invaluable information on how to care for their hives as winter approaches. Supply lines were still hampered, even more so by the delays within the United States Post Office put in place in August. One USDA Sample for the Honey Bee Health Survey sent 2-Day Priority was routed to Dallas, TX, and finally showed up at the lab two weeks later, every bee dead.

LOUISIANA: During the month of August temperatures were mostly normal across most of the state. Precipitation during August was below normal across most of the state. According to the U.S. Drought Monitor website, Louisiana had mostly normal soil moisture for August. Too few prices exist to establish a current market price for wholesale white honey.

MICHIGAN: A hot and dry month limited nectar and pollen collection. What was collected was primarily used by the bees for their brood nest. Bees have foraged on mints, catnip and many garden herbs, along with sunflower, sage, bull thistle, knapweed and Joe Pye weed. Goldenrod is just beginning at month's end. Some beekeepers have just finished with late summer treatments for Varroa mites while hives began raising bees to take them into the winter months. There have been good production reports to date, and honey demand at local markets, farm stands and other outlets remain good with steady pricing. There was a good response to meetings and educational programs have been conducted remotely with the spread of COVID-19.

MINNESOTA: During the month of August temperatures were above normal across most of Minnesota. Precipitation was slightly below normal to normal across the state. According to the U.S. Drought Monitor website, a small area of abnormally dry conditions was present in the Northeast corner and the Southern border of the state during the month. The rest of the State of Minnesota had normal soil moisture conditions during the same period. With good July moisture the overall drier conditions of August provided some fantastic foraging opportunities for bees. The drier conditions providing more fly time for bees and less supplemental feeding. There is hope that with good fly time, bees will still be able to make a good volume of honey.

During August good nectar was available from Basswood Trees and many other types of wildflowers. Overall bees seem to be looking very good. Black bears were not mentioned as a problem to this point.

Demand for Minnesota honey continues to be good for locally sourced honey. Prices for 2020 new crop range mostly from \$1.45-\$1.55. There were a few reports of spot loads up to \$1.80 but that was for single load sales. There is still a lot of talk about imported honey prices.

MISSISSIPPI: Beekeepers are treating the hives and making sure they stay on top of things to prevent extra losses while waiting for the Goldenrod to bloom. They are expecting a better than normal Fall crop coming up in the next few weeks.

MONTANA: No report issued.

NEW ENGLAND: New England weather in August experienced for the most part, average temperatures generally well above normal combined with high humidity early on and throughout the month. Precipitation and soil moisture levels was average and holding steady with light pollen sources and many nectar sources starting to slow and end quickly. New England has experienced hot daytime temperatures in the high 80s and mid 90s and some rain recently after a dry spell. There seems to be a pattern where bees are bringing in little nectar and pollen early in the day and robbing is a problem later in the day with many bees feeding. Keepers report that many bees are hanging outside the hives in order to escape the heat while others line up with their backs toward the entrance and fan their wings to create a cooling air flow through the hive. Many hives have bees clustered on the front of the hive with many hives bearding. This indicates that the bees are not out foraging and are opportunistic to any easy nectar source because of their tendency to swarm to the nearest nectar source.

Regionally we are in a nectar dearth. The dearth (hive weight loss) did not start until about the beginning of August. This is a radical difference from normal, as the dearth usually starts in mid-July, and goes until mid-August. It is amazing how the dry spell this year did not stop the honey flow in July and August. Keepers are reporting that they have had a huge second extraction of honey with basswood, milkweed, smooth sumac, clover, smartweed,

alfalfa, purple loosestrife, sweet pepperbush, beggar ticks, buttonbush and some goldenrod. The late August through September is the beginning of the Japanese knot wood flow however, last year the flow was weak, so it may have a comeback this year. It offers lots of buds and some open flowers which is usually our heaviest flow of the season and produces a very dark honey.

The bees are finding it hard to find nectar with so much heat and humidity. Additionally, many bees are by the water sources as well, which is customary for this time of season and weather pattern. Bees are putting what they are bringing inside the hive into brood production. Bees were working black locust, swamp thistle, button bush, purple loosestrife, wild radish, American basswood/linden, milkweed, winded sumac, staghorn sumac, smooth sumac, buckwheat, sweet pepper bush, meadow sweet (produces a light olive pollen color) as well as vegetable crops and a variety of flowering trees and wild flowers.

Some pollen and nectar sources for bees are the legumes such as alsike clover, purple vetch, birds foot trefoil, alfalfa, and clovers such as white sweet clover and yellow sweet clover and native Joe-Pye-weed as well as the ornamental tree Korean Evodia and corn are all in full bloom at this point in time and the bees are loving it.

August has been busy for most beekeepers as they start making decisions about winter. It is still too early to assess the overall crop for the season as golden rod, knotweed and loosestrife are still blooming.

Varroa mites have been showing to be at high levels and beekeepers are scrambling to treat in order to lower the mite populations. This is often at the loss of any late honey as you do not treat colonies when collecting honey.

Utilizing screened bottom boards helps to keep the mite population down. Varroa mites are typically a problem in August and September. Many keepers are experimenting with brood interruption for mite control. Secondly, keepers are re-queening with local raised queens and this procedure seems to shut down brood production when nectar flows shut down. Currently there are just less and less forage sources available for bees to get a good healthy diet. Consequently, keepers are sugar syrup feeding and feeding pollen with mega food patties as a substitute for natural pollen.

Early harvested honey reportedly was some of the highest quality and lightly colored ever. At that point in time, harvested honey was averaging 50 lbs. per colony. Beekeepers have been busy concentrating on extracting honey. Demand at all retail/wholesale outlets remains good and honey market prices are steady. Prices quoted for retail 1 lb. bottled units were \$9.00 to \$14.00 mostly \$12.00, occasionally higher, and 1 Quart bottled units were \$18.00 to \$24.00 mostly \$22.00, occasionally higher, inclusive of all varieties, and for all raw and natural honey depending on variety and quality.

Additionally, current prices quoted for 1 Quart bottled units for raw pollen were \$28.00 to \$32.00 mostly \$30.00 and for raw Propolis tincture are \$16.00 to \$20.00 mostly \$18.00 for 2-ounce containers. Beeswax is retailing mostly at \$10.00/lb.

NEW YORK: A hot, dry month with a few sporadic thunder showers, making grass dry and plants stunted and stressed, which limited the amount of nectar and pollen produced. Fall yields are likely to be affected by these weather conditions. Some areas of the state are greener than others, which created a scattered pattern of drought. The early goldenrod provided little nectar as pollinators await the fall flow. Bees seems to be in good health, with reduced queen laying during the August dearth. Mite count is minimal but expected to increase as fall nectar is gathered. Beekeepers have busy in preparation for fall and winter seasons. Sales have been slow; stores and honey outlets have begun to see increased foot traffic. Cooler temperatures should help boost honey sales. Local farm stand prices range from \$4.00-9.00 per pound. Big grocery stores have prices between \$3.99-12.00 per pound.

NORTH CAROLINA: Temperatures in North Carolina were above normal for August with a statewide average temperature of 77.5°F. Precipitation was also above normal, with the State experiencing two tropical systems during the month (Hurricane Isaias and the remnants of Hurricane Laura). Overall statewide soil moisture levels were rated 1 percent very short, 16 percent short, 75 percent adequate, and 8 percent surplus the week ending August 29. The North Carolina Drought Management Advisory Council reported zero counties as having outstanding drought or dryness.

Despite some challenging weather conditions, flowers were in bloom and bees were able to forage. Bees could be seen working Heartsease, Smartweed, Knotweed, and Golden Rod in the Piedmont region; Pepperbush and Golden Rod in the Coastal Plains; while Sumac was available across the State. Sadly, it was not always enough as apiary inspectors reported that some hives were nearly or completely starved out. Continuing down that path, pest pressures from varroa mites and small hive beetles were high; in some areas, the heat caused queens to reduce egg-laying; while others saw more swarming than usual for the time of year, small swarms, creating concern for survivability for both the new hives and the old hives come winter. As often noted, colony conditions varied by management practices and experience; the COVID-19 pandemic exacerbated this issue when bee schools and field days were cancelled, leaving a shortage of learning opportunities for novice beekeepers who simply did not know how to manage colony health.

Commercial pollinator hives finished up pumpkin and melon contracts. While others let hives rest in preparation to be moved to Florida for the winter. Demand for replacement bees is seasonally light.

Supply of honey was fairly light compared to normal late-summer supplies, however, it appeared that demands were being met. Retail prices at the Raleigh State Farmers' Market were unchanged: \$7.00-\$8.00 per 8-ounce jar, \$12.00-\$13.00 per 16-ounce jar, \$22.00 per 32-ounce jar, and \$18.00 per 44 ounce jar. Prices at the Piedmont Triad Farmers' Market in Greensboro were also unchanged at: \$8.00-\$12.00 per 8-ounce jar, \$12.00-\$18.00 per 22-ounce jar, and \$20.00 per 32-ounce jar.

NORTH & SOUTH DAKOTA: No report issued.

OHIO: Another hot and dry month, although it has not hindered honeybees from storing large quantities of honey. Most beekeepers have reported higher than normal honey crops this season despite the dryness and heat. Colonies located near soybeans not only improved the pollination and seed set of the field, but also brought in a great deal of nectar. The new concern is if the drought will affect pollen and nectar availability of asters and goldenrod in the drier areas of the state. An interesting phenomenon observed has been honeybees have been storing honey in the brood chambers regardless of the room available in the supers, to the extent that the queen has no room to lay eggs. Varroa mite levels have steadily increased, partly because colonies were not treated with the high temperatures and because varroa mite numbers increase each fall as the number of bees per colony declines. Robbing has already begun and will rise again when the fall flowers diminish. Hives need a steady source of clean water for their colonies. In the North, summer blooming

plants have finished, and Goldenrod is just starting. Most beekeepers have ample amounts of honey this year. Prices remain stable from \$5.00-6.00 per pound wholesale and \$8.00-10.00 retail. In Central Ohio, there were adequate amounts of rainfall at the right time to keep pollinator plants healthy, providing pollen and nectar for the honeybees. Wingstem, Iron Weed and Boneset are blooming and providing a major nectar and pollen flow, with Goldenrod just beginning. Swarm trapping local feral bees has proven to be very successful in the war against varroa mites. In the Southern regions, lack of rain and above average temperatures reduced the nutrition for bees. Beekeepers will need to provide supplemental feedings for overwintering. Honey flows have slowed as the transition to fall flowers is underway. Colony health is the concern now, with treatments for mites needed now. COVID-19 has prevented clubs from meeting in person, so zoom technology has been used to provide training and informing beekeepers of research. There are issues in the state with lack of internet service, that has prevented about 25% of our beekeepers to participate in the online meetings.

OKLAHOMA: During the month of August temperatures were mostly below normal to normal across most of the state. Precipitation during August was below normal across most of the state. According to the U.S. Drought Monitor website, Eastern Oklahoma had normal to abnormally dry soil moisture progressing to extreme drought conditions as you move West. Too few prices exist to establish a current market price for wholesale white honey

OREGON: No report issued.

SOUTH CAROLINA: Brood rearing is in steady decline. Early dry, hot conditions punctuated the peak of the summer dearth resulting in robbing activity followed by heavy rainfall. Colonies struggled with unusually high numbers of small hive beetles.

Hive Beetles are unusually high in population most likely due to the extreme wet weather/soil conditions. Beetles are being moderately controlled with traps. Also, the mite counts are down as a result of a series of July/August Oxalic Acid Vapor treatments. Another series of treatments is anticipated due to high brood count during treatments.

Beekeepers report higher than normal small hive beetle populations. There were reports of new queens being lost due to robbing. Bees are over all recovering from high mite loads.

Local beekeepers report prices as: 2 oz \$3.00, 8oz \$6.00-7.00, 12 oz \$8.00-10.00, 16 oz \$10.00, 22 oz \$13.00-19.00, 32 oz \$15.00-20.00, 80 oz \$45.00.

TENNESSEE: Nectar and pollen sources during the month of August were scarce. Some beekeepers extracted all of their honey in June and July had to feed their bees in August. Late August saw asters and goldenrod beginning to bloom to start the fall nectar and pollen flow.

TEXAS: During the month of August temperatures were about normal above normal across most of the state. Precipitation during August was below normal to normal across most of the state. According to the U.S. Drought Monitor website, Central and most of West Texas had abnormally dry to extreme drought conditions for the month. The remainder of the state shows normal to abnormally dry conditions.

August was exactly what you expect in Texas, hot and dry. When temperatures go into the triple digits in mid-May most Texans are expecting a hot summer. Mother nature did not let them down. The second hurricane to hit the coast this season actually hit in Louisiana just across the state line. Most of the state saw very little to no rainfall from it as it turned North going up through Louisiana at the end of the month. Too few prices exist to establish a current market price for wholesale white honey.

WASHINGTON: No report issued.

WISCONSIN: The weather for August was hotter and dryer than usual. Beekeepers report no real problems with mosquitoes, and some have treated for mites. Most bees are in good condition, but some are in poor condition. Foliage such as Goldenrod, white snakeroot, phlox, mint, asters, clovers, Joe pye weed, amaranth, cleome (turtlehead), Queen Anne's lace, tansy, elderberry, boneset, ragweed and nettles are available for the bees. Some beekeepers report that production was good, while others report that it was just average. Demand for honey is good at the retail level and fairly good at the wholesale level. Prices are generally unchanged.

The export data is sourced from the Census Bureau.
